

ABSTRACT

A lighted image display comprises an image frame box having a front panel, wherein a large portion of the front panel is transparent and is not imaged. A rear panel of the frame box is spaced apart from the front panel. The rear panel has an image formed upon it, or attached to it. An electric light is disposed between the front panel and the rear panel, and light is emitted from the electrical light between the front panel and the rear panel. The light is reflected from the rear panel through the transparent portion of the front panel. The image, such as a photograph, is lighted by the electrical light, and viewed through the transparent portion of the front panel.
